Confounders (all adjusted in the primary model)
Background
Social
Behaviour and reproductive history
Pre-pregnancy health
Study site
Education
Pre-pregnancy BMI
Race and ethnicity
Family income
Smoking during pregnancy
Pre-pregnancy diabetes
Maternal age
Marital status
Chronic hypertension
Infant sex
(no maternal causes)
Parity
S = 1: survived to one year and examined at 12 months
40,700 of 45,268 included
(1,834 died, 2,734 not examined)
Addressed with stabilised IPCW
(MVM, AI, 11 covariates, site)
incl. site: pathologist reading practice
incl. site: paediatric ascertainment of IH
IH observed only if S = 1
Exposure: placental pathology
(1) MVM, any lesion (and score, 0 to 8)
(2) AI, any maternal or foetal neutrophilic inflammation
(3) Joint: MVM only, AI only, both
Association of interest
(total effect)
Outcome: infantile haemangioma
Definite IH recorded at the 12-month paediatric examination
(suspect IH counted as absent)
Gestational age at delivery and foetal growth
(potential mediators, not adjusted)
